COOLING TOWER DEMOLITION

R W CLARKE LTD

STRUCTURAL ENGINEER

IndEx personnel have been involved in the successful demolition of numerous cooling towers in the UK, India and South Africa as either, explosives contractors, consultants, project managers or senior explosives engineers. This involves often working to tight deadlines within live power stations close to sensitive electrical equipment.

Because of the design of the structures and using various proven techniques most cooling towers can be dropped virtually within their own footprint or tilted slightly away from sensitive equipment with minimum vibration.

With structural calculations to prove both the stability of the structure during preparation, and the mechanics of the collapse, the use of explosives to demolish cooling towers has proven to be not only the safest method but also the most cost effective.

For more information on cooling tower demolition please contact,
