TOWER BLOCK DEMOLITION

Over the last 15 years Explosives Engineering and the demolition of high rise tower blocks has become a fine art.

Over that period explosives engineers now working for IndEx have been involved with hundreds of successful tower block demolitions using controlled explosive techniques.

Explosives not only offers the client a quicker and more cost effective alternative to conventional techniques but often also a safer one.

It is now possible to safely bring down high rise buildings in close proximity to other structures and live services. By using a combination of small explosive charges and strong protective materials, we can ensure no explosively driven fly comes out of the building being demolished, and the structure falls almost within its own footprint.

IndEx can not only prepares the building for explosive demolition but also organise and assist in all the planning and coordination involved with these prestigious projects.

Whatever level of involvement you require to complete the project IndEx has the experience and competence to ensure a successful conclusion.

For more information on tower block demolition worldwide please contact.
